Floyd-Warshal

Applications

Adjacency matrix

- Adjacency matrix
- ► For every node *k*:

- Adjacency matrix
- ► For every node *k*:
- For every pair of nodes (u, v):

- Adjacency matrix
- ► For every node *k*:
- For every pair of nodes (u, v):
- Can the distance between these pairs be improved by going to *k* first?

- Adjacency matrix
- ► For every node *k*:
- For every pair of nodes (u, v):
- Can the distance between these pairs be improved by going to *k* first?
- g[u][v] = min(g[u][v], g[u][k] + g[k][v])

- Adjacency matrix
- ► For every node *k*:
- For every pair of nodes (u, v):
- Can the distance between these pairs be improved by going to k first?
- g[u][v] = min(g[u][v], g[u][k] + g[k][v])
- Very easy implementation (4 lines)

- Adjacency matrix
- ► For every node *k*:
- For every pair of nodes (u, v):
- Can the distance between these pairs be improved by going to k first?
- g[u][v] = min(g[u][v], g[u][k] + g[k][v])
- Very easy implementation (4 lines)
- $> O(|V|^3) \Rightarrow$ feasible for up to approx. 400 nodes

► Reconstructing the path:

- Reconstructing the path:
- ▶ Use another $|V| \times |V|$ matrix parent

- Reconstructing the path:
- ▶ Use another $|V| \times |V|$ matrix parent
- ho parent[u][v] = The last node before v on the shortest path from u to v

- Reconstructing the path:
- ▶ Use another $|V| \times |V|$ matrix parent
- ho parent[u][v] = The last node before v on the shortest path from u to v
- ▶ Update when improving a path (parent[u][v] = parent[k][v])

- Reconstructing the path:
- ▶ Use another $|V| \times |V|$ matrix parent
- ho parent[u][v] = The last node before v on the shortest path from u to v
- ▶ Update when improving a path (parent[u][v] = parent[k][v])
- ► Traverse the *parent chain* upwards

Floyd-Warshall Alternative

Repeated execution of Dijkstra's algorithm

Alternative

- Repeated execution of Dijkstra's algorithm
- $\triangleright O(|V| \times |E| \times \log |V|)$

Alternative

- Repeated execution of Dijkstra's algorithm
- $O(|V| \times |E| \times \log |V|)$
- artriangle Better on sparse graphs $(|E|<<|V|^2)$

Table of Contents

Floyd-Warshall

Applications

Compute the transitive closure close[u][v] = close[u][v]|(close[u][k]&close[k][v])

Applications

- Compute the transitive closure close[u][v] = close[u][v]|(close[u][k]&close[k][v])
- Minimax of the graph: The path with minimal highest cost along the path

```
g[u][v] = min(g[u][v], max(g[u][k], g[k][v]))
```

Applications

- Compute the transitive closure close[u][v] = close[u][v]|(close[u][k]&close[k][v])
- Minimax of the graph: The path with minimal highest cost along the path

```
g[u][v] = min(g[u][v], max(g[u][k], g[k][v]))
```

Maximin of the graph: The path with maximal lowest cost along the path

```
g[u][v] = \max(g[u][v], \min(g[u][k], g[k][v]))
```

Applications

- Compute the transitive closure close[u][v] = close[u][v]|(close[u][k]&close[k][v])
- Minimax of the graph: The path with minimal highest cost along the path

$$g[u][v] = min(g[u][v], max(g[u][k], g[k][v]))$$

Maximin of the graph: The path with maximal lowest cost along the path

$$g[u][v] = \max(g[u][v], \min(g[u][k], g[k][v]))$$

Safest path: the path with highest survival probability (weights are probs along the edge) g[u][v] = max(g[u][v], g[u][] * g[k][v])

Applications

- Compute the transitive closure close[u][v] = close[u][v]|(close[u][k]&close[k][v])
- Minimax of the graph: The path with minimal highest cost along the path

$$g[u][v] = min(g[u][v], max(g[u][k], g[k][v]))$$

Maximin of the graph: The path with maximal lowest cost along the path

$$g[u][v] = \max(g[u][v], \min(g[u][k], g[k][v]))$$

- Safest path: the path with highest survival probability (weights are probs along the edge) g[u][v] = max(g[u][v], g[u][] * g[k][v])
- Most dangerous path: the path with lowest survival probability (weights are probs along the edge) g[u][v] = min(g[u][v], g[u][] * g[k][v])

Detecting negative weight cycles

- Detecting negative weight cycles
- ► Run the normal Floyd-Warshall algorithm

- Detecting negative weight cycles
- ► Run the normal *Floyd-Warshall* algorithm
- ightharpoonup If any element on the diagonal becomes negative \Rightarrow negative weight cycle found
